

Before You Begin

By Marin Todorov

The project you are working on in this video course uses CocoaPods for dependency management. To work through the videos you will need to have the latest version of CocoaPods installed on your computer; you can get it for free from here: <https://guides.cocoapods.org/using/getting-started.html>.

Before you can work on any of the demo or challenge projects in Xcode, you need to run `pod install` in each project's folder to install its dependencies and then open the file with `.xcworkspace` extension.

Note: For more ways to include Realm in your own projects (outside this course) check Realm's installation guide: <https://realm.io/docs/swift/latest/#installation>.
